Teaching Statement

My goal as a teacher is to help students gain the confidence and judgment to work through unfamiliar problems. I believe this requires clear explanations, regular practice, and opportunities to ask questions before a difficulty becomes a barrier to further learning. At Binghamton University, I taught **Statistical Methods in Summer 2025**. Since Fall 2022, my teaching assistantships have included Introduction to Microeconomics, Principles of Microeconomics, Introduction to Macroeconomics, Intermediate Microeconomics, Corporate Economics, Introduction to Econometrics, and Advanced Data Analytics. In Introduction to Econometrics in Fall 2025 and Fall 2026, I teach econometric concepts and lead R instruction.

I am prepared to teach principles of microeconomics and macroeconomics, intermediate microeconomics, managerial economics, statistics, and introductory econometrics, as well as electives in applied econometrics, causal inference, panel data, and data analytics. Across these courses, I place students' ability to use and explain what they learn at the center of my teaching.

Responding to Students' Learning Needs

In my teaching assistant role in Introduction to Econometrics, I worked with students who struggled to understand the course concepts. I responded by taking more time to explain ideas from their foundations and organizing extra classes and additional office hours. I connected concepts and problems to real-life examples, then reinforced those explanations through practical examples in the lab. My purpose was to give students time to build the underlying intuition and connect it to an application. To assess their understanding, I asked students to explain the concepts back to me in their own words. This made checking understanding part of the discussion: I could listen to their reasoning rather than rely only on whether they said an explanation was clear.

I organize my teaching around the work students do between explanations. Following a solution during a lecture is only one step toward being able to solve a problem independently. I assigned weekly homework to give students regular opportunities to attempt the material, and I provided additional practice questions to support preparation for assessments. My purpose was to encourage sustained engagement and give students time to identify a difficulty, return to an explanation, and try again before an examination.

To support that process, I created online lecture videos on course topics and difficult concepts and uploaded my slides and lecture notes. I did this because a single explanation at a fixed pace cannot meet every student's needs. With a recording, students can pause at a difficult step and revisit it alongside the notes while working on a question. Making these resources available gives students more control over the pace of their learning. I see the homework and supporting materials as connected: practice gives students a reason to revisit an explanation, and the explanation supports their next attempt.

Using Explanations to Examine Understanding

I want students to understand why a method applies and what an answer means. In my microeconomics teaching, I begin with an economic question before developing the formal argument. When discussing a tax, for example, I ask students to predict its effects, work through the graph, and explain the result in words. The purpose of moving between a prediction, a diagram, and a verbal explanation is to make the reasoning visible. It gives students several ways to approach the problem and gives me a basis for assessing what they understand beyond the final answer.

I also created an online collaboration platform where students could discuss difficult concepts with classmates before bringing unresolved questions to me. The purpose was to make explaining an idea part of learning it. Putting a question into words and considering another student's approach offer ways to examine one's own understanding. I complemented this space with flexible office hours and encouraged students to contact me when questions arose. Together, these practices made room for both peer discussion and individual support.

These activities reflect the standard guiding my assessment: students should be able to explain their choices and interpret their answers. I listen for the connection between an idea, the steps used to apply it, and the conclusion. An explanation provides a basis for deciding what needs further attention, alongside the evidence provided by homework and examinations.

Building Confidence and Purpose

Students bring different levels of preparation and confidence to quantitative courses. I want them to have a practical next step when they become stuck and to regard asking a question as an ordinary part of learning.

My experience in banking, e-commerce, and media analytics also informs why I emphasize clear interpretation and communication. In econometrics, students work with reproducible R scripts that connect data preparation, estimation, and interpretation. I emphasize documentation because an analysis needs to be understandable to someone who did not produce it. These habits help students prepare for further study and for work in which colleagues rely on their analysis to make decisions.

The purpose of my teaching is to help students become more capable learners: willing to attempt a difficult question, able to explain their reasoning, and ready to seek help or further evidence when needed. I support that development through regular practice, accessible explanations, and opportunities to work through questions with others.
